

Iran has not converted the low-grade uranium that it has produced into weapon-grade uranium, inspectors belonging to the International Atomic Energy Agency have said.

The Austrian Press Agency quoted an IAEA expert as saying that the uranium substances that Iran has produced at its Natanz enrichment facility have been carefully recorded and remote cameras have been installed to supervise part of the stockpile.

“If the Iranians intend to transport these uranium substances to a secret location for further processing, agency’s inspectors will find out,” he said.

The expert added that “so far, Iran has carried out good cooperation with us in relevant verifications”.
